

Age Defy Eye Repair

**NEW
TECHNOLOGY**
GUARANTEED TO REDUCE
DARK CIRCLES

Age Defy Eye Repair is a revolutionary eye complex that combines novel ingredients that fight the signs of aging. It enhances the skin's natural ability to eliminate bilirubin and iron which are the causes of dark circles and at the same time also improved microcirculation of the blood vessels to counteract the unsightly blackish-brown ring under the eye. Age Defy Eye Repair combines the best of both worlds, the natural active of sweet almond and powerful peptides to reduce wrinkles and puffy eyes.

It also provides an immediate anti-wrinkle effect due to formation of continuous and elastic film on the skin surface upon application, thus it is proven to improve the smoothing of microrelief.

Age Defy Eye Repair provides the following:

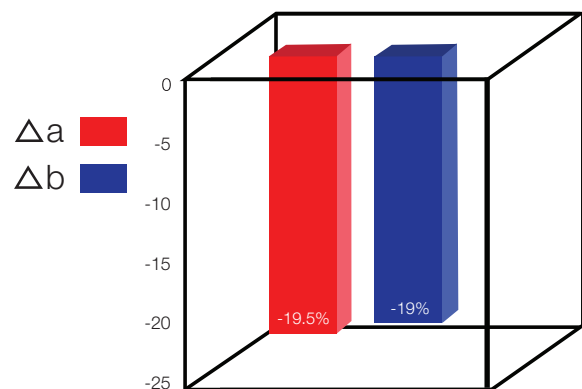

- ✓ **Increase collagen synthesis that can reconstruct healthy skin.**
- ✓ **Strengthening skin density and enhance the natural elimination of biliverdin/bilirubin and iron to reduce dark circles.**
- ✓ **Reduces puffy eyebags with an anti-oedema property.**
- ✓ **Reduce skin redness.**
- ✓ **Improves skin radiance, smoothness, and firmness.**
- ✓ **Improves skin elasticity and moisturization.**

Age Defy Eye Repair (anti dark circle)

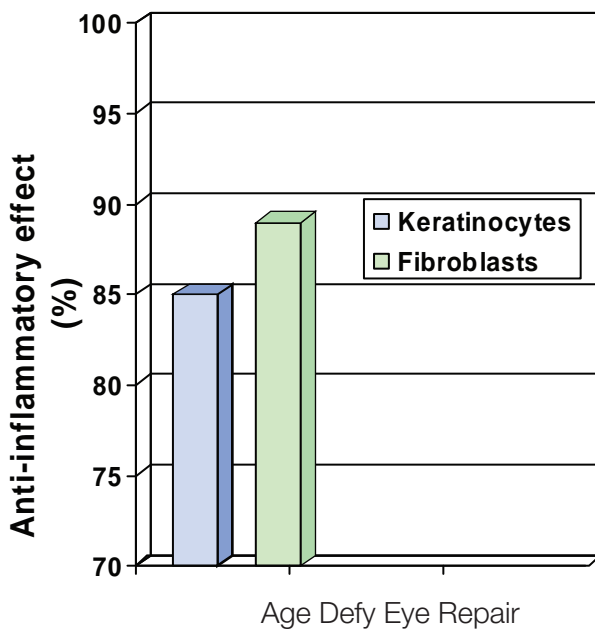

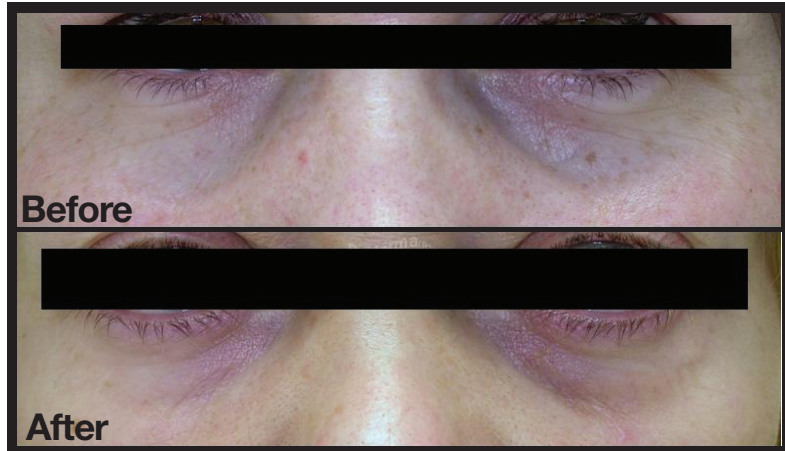

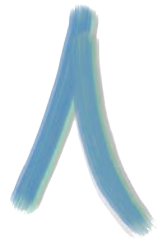

Fragile and sensitive, the zone around the eyes is a visible reflection of our tiredness, worries, stress, and sleepless nights. This formation of rings under the eyes is considered the consequences of accumulation of the pigment degradation products of heme in the richly vascularized zones around the eyes. This accumulation of pigments is due to cutaneous deposit of the bilirubin/biliverdin and iron which are the result of degradation of heme. In order to improve the unsightly blackish-brown ring under the eye, it is essential to enhance the skin's natural ability to eliminate bilirubin/biliverdin and iron.

Age Defy Eye Repair is a complex eye cream that is proven to reduce dark circles in just 2 months which also has an anti-inflammatory effect.

Reduction of red and blue component

22 volunteers with dark circles (average age 32) applied Age Defy Eye Repair twice a day for 56 days to the contour of one eye and placebo on the other side. After 56 days, 72% of the volunteers had a reduction of red component by 19% and 63% of the volunteers had a reduction of blue component by 19%. Overall, the violet (red + blue) appearance was significantly alleviated.

If iron complexation and elimination of excess bilirubin occurs, a positive contribution of the product to the known pro-inflammatory effects of iron and bilirubin is to be expected. Anti-inflammatory activity reduces microvessels vasodilatation and decreases the local leakage of erythrocytes. Prostaglandins PGE2 are conventionally considered as mediators of inflammatory stress, particularly following UV-radiation exposure. With Age Defy Eye Repair an anti-inflammatory activity is noted. Age Defy Eye Repair anti inflammatory effect on the keratinocytes increased up to 85% and 89% for the fibroblasts.

Age Defy Eye Repair (anti wrinkle)

A wrinkle is a fold in the skin caused by age, weight loss, lifestyle, and harmful environmental exposure. Wrinkles in the skin is a depletion of collagen. As we age, the skin gets thinner thus reducing the area of exchange between the dermis and epidermis. The loss of adhesion between these two structure is normally provided by collagen. Therefore, in order to reconstruct a healthy skin, we need to improve the collagen synthesis in the skin. Age Defy Eye Repair produces a highly significant increase of collagen in the skin thus reducing the appearances of wrinkles.

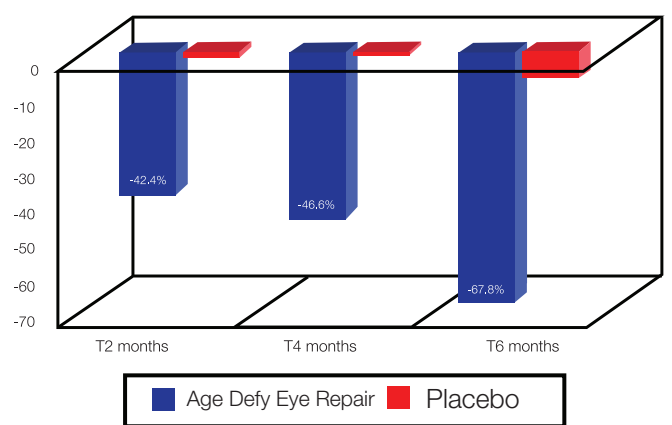

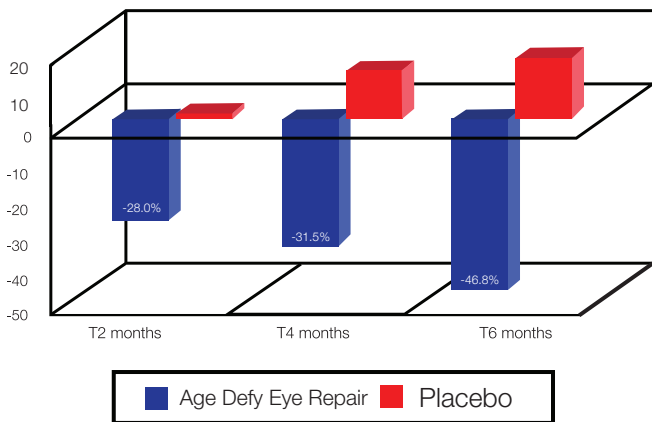

Imprints of the relief of the skin were obtained by applying Silfo gel over the wrinkles at the corner of the eye. This gel polymerises in situ and after being removed it yields a negative imprint of the irregularities of the skin surface. These irregularities and the wrinkles in particular, were analyzed by image analysis after illuminating the imprints with a grazing light beam (halogen light at 25). This method yielded several parameters including the surface irregularities, the density of furrows, and skin roughness.

Surface area of wrinkles was measured on the skin treated with placebo compared to Age Defy Eye Repair. A highly significant reduction in surface area of wrinkles was obtained by Age Defy Eye Repair. The surface area of wrinkles, treated with Age Defy Eye Repair, decreased by 42% in 2 months and after 6 months, it decreased by 67%. No significant effect from the skin treated with placebo.

Reduction of surface area of wrinkles

Reduction of density of main furrows

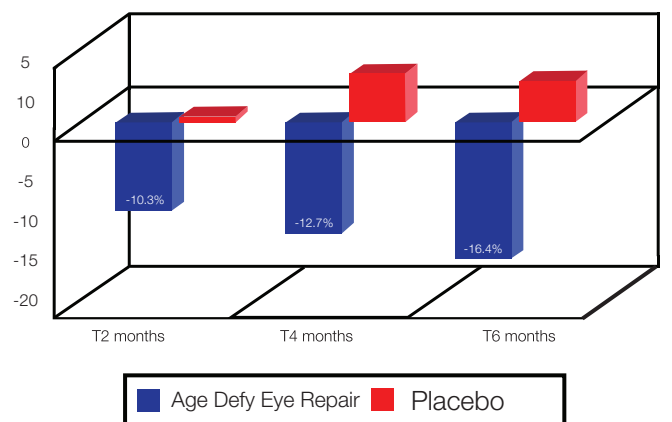

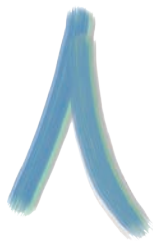

A very marked reduction in the density of furrows was found for Age Defy Eye Repair whereas the placebo tended to have the opposite effect. The results produced by Age Defy Eye Repair improved with time, 2 months after application reduced by 28%, after 4 months reduced by 31% and after 6 months reduced by 46%. However, skin treated with placebo, not only did it not decrease the density of main furrow, but after 4 months the skin density main furrow increased and the same result was noted after 6 months.

A very significant improvement in skin roughness was also noted on the skin treated with Age Defy Eye Repair. Two months after treatment with Age Defy Eye Repair, skin roughness decreased by 10% and in 6 months the skin roughness decrease by 16%. Whereas on the skin treated with placebo, it showed the opposite effect. Two months after treatment with placebo, the skin did not show any significant changes, however after 4 months the skin roughness increased and after 6 months the skin roughness did not improved much.

It is without a doubt that Age Defy Eye Repair smooths the microrelief of the skin and this effect increases with time.

Reduction of skin roughness

Age Defy Eye Repair (Immediate anti wrinkle effect)

Age Defy Eye Repair contains cross-linking technology of biopolymerization of sweet almond protein that forms a cutaneous, elastic film that smooth the microrelief, thereby providing an immediate anti-wrinkle effect. Age Defy Eye Repair also tones the skin, renders it firmer and more radiant.

Age Defy Eye Repair (Anti eye bags)

With age, skin loses its elasticity and muscles weaken through age. Loose skin can accumulate around the eyes and forming fold in the eyelids. Fat, which cushions the eyes in their sockets moved forward out of the ocular cavities and accumulated in bulging bags around the eyelids. The other cause for puffy eyes is water accumulation or known as eyelid oedema. Age Defy Eye Repair is a proven eye cream that reduces the puffy eyes with proven anti-oedema properties.

20 female volunteers aged 18 to 65 applied NeutralEyes® twice a day for 60 days and puffiness under the eyes is greatly reduced, even after only 15 days. 70% of the volunteers had improved at Day 15. At the end, 95% of the volunteers had improvements.

1 – no reduction,
2 – slight reduction,
3 – fairly good reduction

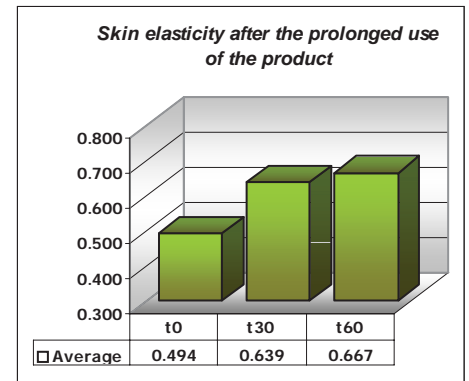

Age Defy Eye Repair (Skin Moisturization)

Healthy skin is skin that is hydrated. The higher the water content of the skin, the lower the skin dryness. This skin moisturization effect is measured by Corneometry. As can be seen from the graph, the skin moisturization increases after 60 days of usage.

Age Defy Eye Repair (Skin Elasticity)

Skin Elasticity is measured using Cutometer. Elasticity represents the recovery degree of the maximum deformation reached, whose value range between 0 and 1 (maximum elasticity). The experimental measurement, as well as statistical analysis are shown on the graph:

As can be seen from the graph, skin elasticity increased by 30% after 30 days of use.
